

# HYDROELITE

## INSTALLATION TIME

### Shortest down time

Wiring between the controller and the power unit is done in the factory. All other wiring is pre-terminated. Setting the floor zones, acceleration/deceleration rates and points as well as gains and the rest of the fine tuning typically take 10-15 minutes due to the advanced learning algorithms.

**Because of all these features the Installation time is reduced for approximately 40%.**

Every system is connected to a test tower in the factory and both electrical and hydraulic components are tested before dispatch. When the unit is delivered on site it requires to re-connect the mains and the cylinder, fill the tank with oil and **the lift will run on construction mode, most of the time during the first day on site.**

**CERTIFIED**
